Qt for HarmonyOS Prerequisites

On this page

Note: Qt for HarmonyOS is in technology preview and may change in future releases.

To develop Qt applications for HarmonyOS, you need to set up your development host with the OpenHarmony SDK and the related command-line tools.

The same prerequisites apply whether you build **Qt for HarmonyOS** from source or use a pre-built Qt for HarmonyOS to build and deploy your own applications.

Prerequisites

- The OpenHarmony SDK command-line tools, which provide the compiler toolchain, the system libraries, and the `hvigor` build tool used to assemble a HarmonyOS Ability Package (HAP).
- Optionally, **DevEco Studio**, the official IDE for HarmonyOS, which is convenient for running and debugging applications on a device or the emulator.

Supported development hosts

The Qt for HarmonyOS toolchain is currently developed and tested on Linux.

Setting up the SDK

After installing the OpenHarmony SDK command-line tools, point Qt at the SDK so that the build system can locate the toolchain and system libraries. This is required both when configuring a Qt for HarmonyOS build from source and when building applications against a pre-built Qt. You can do this in two ways:

- Set the `OHOS_SDK_ROOT` environment variable to the SDK root path.
- Pass the path to **configure** using the `-ohos-sdk` option.
